

Latest Edits Dashboard

This is a simple dashboard for the Developer section, which shows you the latest edited content nodes, specifically:

- Pages created today
- Pages updated today
- Pages created yesterday
- Pages updated yesterday

It shows the latest 10 entries in descending order - a node that was created *and* updated on the same day (very common) will only show in the “created” section, so it doesn’t also take another node’s spot in the “updated” section.

Each node displayed will show the DocumentType’s alias and the Name of the node, e.g.:

```
1. Textpage: Our battle tactics revealed
2. BlogPost: Crywolf interviewed
etc.
```

It puts an “Edit” link right next to each node, so you can jump immediately to the editing page for it. If you’re using the XMLDump package, there’s also an “XML” link that opens the page in XMLDump for you.

Customization

The best part is: It’s just a standard XSLT Macro (yes, XSLT) that you can edit to your heart’s extent.

Have to see more than 10 entries per section? Change the `itemsToShow` variable, hit “Save” - and there you have it. Need to filter out some DocumentTypes? Change the `nodes` variable. Etc.
